Spark Gap

Description

SPG (Spark Gap Protectors) is a discharge micro gap obtained by the distance between electrodes. The tube is filled with inert gas and sealed with glass tube and Du magnesium wire. When the voltage at both ends of SPG increases, the nearby gas is ionized and discharge phenomena begin to occur at the micro gap. As the voltage drop between the two poles gradually increases, the discharge current also increases, and its ionization zone expands. At this time, the discharge current flows through the gas ionization zone to the other pole. When the current continues to increase to a certain extent, there is a transition from glow discharge to arc discharge inside the tube, and the product enters a low resistance state from a high resistance state. The voltage at both ends of the SPG also decreases, thus protecting the subsequent circuit. After the abnormal voltage disappears, the product returns to a high resistance state.
